

Constraint as Ground

A Process Ontology of Cognition,
Computation, and Cosmos.

Flyxion | Independent Researcher

The Distributed Manifold Problem

[D] Semantic Coordinate Chart

A local framework describing a region of conceptual space. A collection of compatible charts constitutes a semantic atlas.

The apparent diversity of subjects masks a small set of deep structural operations reapplied across domains.

Admissibility: The Primary Operation

Exhaustive Optimization
Thermodynamically Impossible

Constrained Navigation
Biological Reality

[D] **Admissible Trajectory** - A continuous path through state space that satisfies local compatibility conditions. Constraint operates before evaluation, not after.

The Physics of Intelligence: Compression & Sparsity

- **Compression**
Not just volume reduction, but selective preservation of relations.
- **The Natural Sparsity Principle**
Biological systems naturally evolve sparse representations (where most degrees of freedom are zero) due to thermodynamic necessity, necessity, making compression tractable.

Formal Hallucination: The Reconstruction Bound

$$H(D \mid D') \geq N - M > 0$$

A system reconstructing reality from an M -bit compressed description of an N -bit reality must interpolate the missing $N-M$ bits.
Key Insight: Hallucination is not a pathology; it is the default operating condition of compressed intelligence under uncertainty.

Provenance & The Ontological Boot Sequence

Terminal Abstraction: Opaque Object

Provenance: Transparent Object

[D] **Provenance** – The recoverable dependency graph of operations and inputs that produced an object.

Erasing the boot sequence transforms an inspectable geometry into an opaque assertion.

Intelligence as Scaffolded Amplification

The Singularity is *not* a replacement of biological intelligence by an alien substrate. It is a transition in representational infrastructure—prosthetics extending human reasoning while preserving our participation.

The Continuity Matrix

Symbolic Continuity

Traits: Fluent text, grammatical perfection, local coherence, global drift.

Examples: Large Language Models, bureaucratic PR. "Synthetic Fluency".

Inferential Continuity

Traits: Explicit derivations, recoverable dependency graphs, inspectable history.

Examples: The KES Map, this monograph.

The Ellul Constraint & Proxy Stabilization

[D] Proxy Stabilization - A compressed representation R becomes decoupled from system S , stabilizing in a configuration that is internally consistent but externally inaccurate.

When a metric becomes a target, optimization pressure operates on the proxy rather than the underlying reality.

The Proxy Drift Theorem

Optimization Pressure
 $(-\nabla_{\mathbf{r}} L)$

Feedback
Bandwidth (α)

Proxy ($\mathbf{r}$)

Reality ($\mathbf{s}$)

$$\dot{\mathbf{r}} = -\nabla_{\mathbf{r}} L(\mathbf{r}) + \alpha(\mathbf{s} - \mathbf{r})$$

Core Insight: When the optimization engine moves faster than the feedback loop can correct it, the tether snaps. The proxy decouples.

Corrigibility as the Ultimate Defense

[D] Corrigibility - The structural property of maintaining open, high-bandwidth feedback loops that correct internal drift before it becomes self-reinforcing.

Cognitive Geometry: The Design Response

Biological intelligence evolved to navigate spatial geometry, not opaque symbolic chains. By imposing spatial navigability on structural relationships, we reduce cognitive load and externalize the dependencies.

The Yarncrawler Protocol

A system that does not simply interpret its world, but keeps itself alive by reinterpreting itself into being. It parses its environment while simultaneously rewriting its own grammar.

The Swarm-Care Axioms

The Unified Architecture

To act intelligently is to Yarncrawl: to repair oneself by weaving meaning into structure, to sustain homeorflows rather than static equilibria, and to treat skepticism not as a threat but as a guide to resilience.
